Aver Tabcam Visualiser

TabCam - wirelessly connect a visualiser to your iPad, Android and Win 8 devices

Stream. Present. Record. Share.

TabCam enhances mobile, digital curriculum

As a wireless streaming camera, **TabCam captures and broadcasts live, physical classroom content to your iPad, Android Tablet or PC/MAC Laptop in real-time**. It also keeps your mobile device mobile, able to move anywhere in the room without having to be near it. The tablet app and software package then takes that real content and enables students to fully interact and engage with the content in a way that is both familiar and captivating to them.

Present and create rich, full lessons

Present live video of anything, from anywhere in your room, while annotating, highlighting and manipulating the content from your tablet or laptop without being tethered to the camera. Present student or group work from one end of the room while interacting with the content for another group elsewhere. Add supporting content such as images or video from other sources to strengthen the lesson, include alternative solutions, and more.

Don't forget it, record it!

The rich lessons you create with TabCam do not have to be forgotten. TabCam will record your entire lesson to be available for flipping your classroom, review, absent students, substitute teachers and more. **All of your live video, audio, annotation, highlights, and supporting content are captured and saved** even as you move from element to element.

Blended, Flipped and Interdisciplinary

TabCam not only digitizes content for Blended Learning, but can instantly share recorded lessons to DropBox, YouTube, Facebook, even your classroom management site to support Flipped concepts. Furthermore, interdisciplinary curriculum can be created, recorded and shared between subjects.
